

Northwind Robotics - IT & Network Policy

1. Office Wireless Network

The primary office wireless network is named NW-CORP. The wifi password is Ferrite-Anchor-88 and is rotated every 90 days. IT announces the new password by email one week before the change.

A separate guest network, NW-GUEST, uses the password welcome2northwind. The guest network is isolated from all internal systems and must be used for visitor devices.

Personal phones may connect to NW-GUEST only. Connecting a personal device to NW-CORP is a policy violation.

2. VPN Access

Remote access to internal systems requires the company VPN. Request access through the IT portal; approval typically takes one business day. VPN sessions expire after 12 hours and must be re-authenticated with your hardware security key.

Split tunnelling is disabled. All traffic routes through the company gateway while the VPN is active.

3. Software and Licensing

Approved software is listed in the IT portal catalogue and can be installed without a request. Anything outside the catalogue needs written approval from IT before installation.

Open-source software with a permissive licence (MIT, Apache 2.0, BSD) is pre-approved for development use. Copyleft licences such as GPL require review by the legal team before use in any product that ships to customers.

4. IT Support Desk

The support desk is staffed 08:00 to 18:00 on working days. Outside those hours, only production incidents are handled, via the on-call pager.

Standard requests are answered within one business day. Password resets and account lockouts are treated as urgent and handled within one hour during staffed times.

Lost hardware security keys must be reported immediately. A replacement key is issued within two working days, and the lost key is revoked the same day it is reported.
